Plagiarism Declaration

This form needs to accompany your COSC 364 assignment submission.

I understand that plagiarism means taking someone else's work (text, program code, ideas, concepts) and presenting them as my own, without proper attribution. Taking someone else's work can include verbatim copying of text, figures/images, or program code, or it can refer to the extensive use of someone else's original ideas, algorithms or concepts.

I hereby declare that:
- My assignment is my own original work. I have not reproduced or modified code, figures/images, or writings of others without proper attribution. I have not used original ideas and concepts of others and presented them as my own.
- I have not allowed others to copy or modify my own code, figures/images, or writings. I have not allowed others to use original ideas and concepts of mine and present them as their own.
- I accept that plagiarism can lead to consequences, which can include partial or total loss of marks, no grade being awarded and other serious consequences, including notification of the University Proctor.

1   Problem Description

Given a network (figure 2) with X source nodes, Y transit nodes and Z destination nodes, a program was designed to generate an LP file that could be used by CPLEX to determine certain network characteristics.

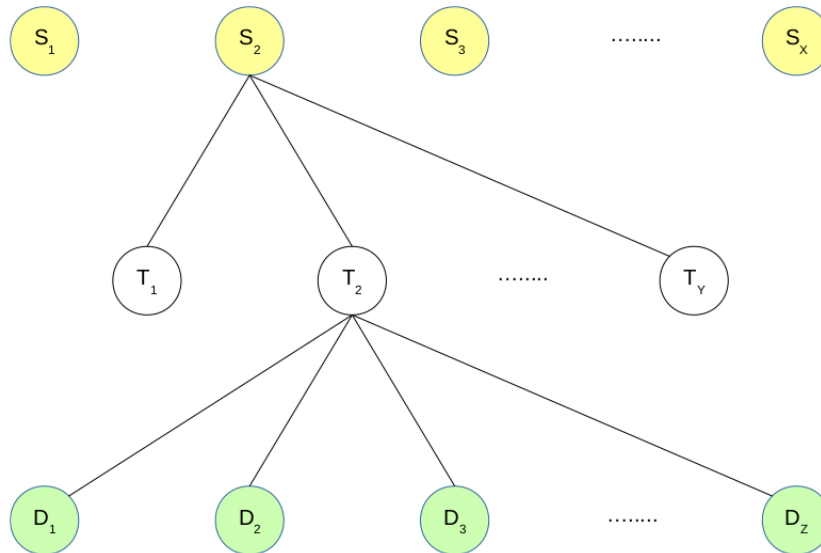

Figure 2: An example network (A. Willig, April 2019).

Traffic travelling from S_i to D_j must travel through exactly 2 transit nodes with a total demand volume of h_{ij} (equation 10). Furthermore, the load upon each transit node must be balanced.

2   Problem Formulation

This problem was solved with the use of binary variable constraints (equations 6, 7 and 9) and the minimisation of our objective function (equation 1). All normal non-negativity constraints were applied (equations 11, 12, 13 and 14).

The following network properties were solved for:

- The capacities of each link (equations 3 and 4).

- The load on each transit node (equation 5).

- The value of each flow (equations 2 and 8).

Notation:

- X is the number of source nodes.

- Y is the number of transit nodes.

- Z is the number of destination nodes.

- S_i is the ith source node.

- T_k is the kth transit node.

- D_j is the jth destination node.

- h_{ij} is the demand flow between S_i and D_j. This is equal to $2i + j$.

- c_{ik} is the link capacity between S_i and T_k.

- d_{kj} is the link capacity between T_k and D_j.

- x_{ikj} is the decision variable associated with the path S_i-T_k-D_j.

- u_{ikj} is the binary decision variable associated with x_{ikj}. These are required because h_{ij} must be split across exactly 2 transit nodes.

- l_k is the load on T_k.

Note: Due to the limitations of the LP file format, many of the following equations must be rearranged for use in CPLEX. Most notably, there cannot be any variables on the right hand side of an equality or inequality.

2.1 Objective Function

$$\text{minimize}_{[x,c,d,r]} \ r \tag{1}$$

2.2 Constraints

$$\sum_{k=1}^{Y} x_{ikj} = h_{ij} \qquad\qquad i \in \{1,\ldots,X\}, j \in \{1,\ldots,Z\} \tag{2}$$

$$\sum_{j=1}^{Z} x_{ikj} = c_{ik} \qquad\qquad i \in \{1,\ldots,X\}, k \in \{1,\ldots,Y\} \tag{3}$$

$$\sum_{i=1}^{X} x_{ikj} = d_{kj} \qquad\qquad k \in \{1,\ldots,Y\}, j \in \{1,\ldots,Z\} \tag{4}$$

$$\sum_{k=1}^{Y} x_{ikj} = l_k \qquad\qquad i \in \{1,\ldots,X\}, j \in \{1,\ldots,Z\} \tag{5}$$

$$\sum_{k=1}^{Y} u_{ikj} = 2 \qquad\qquad i \in \{1,\ldots,X\}, j \in \{1,\ldots,Z\} \tag{6}$$

$$x_{ikj} = \frac{u_{ikj}h_{ij}}{2} \qquad i \in \{1,\ldots,X\}, k \in \{1,\ldots,Y\}, j \in \{1,\ldots,Z\} \tag{7}$$

$$\sum_{i=1}^{X}\sum_{j=1}^{Z} x_{ikj} \leq r \qquad\qquad k \in \{1,\ldots,Y\} \tag{8}$$

$$u_{ikj} \in \{0,1\} \qquad i \in \{1,\ldots,X\}, k \in \{1,\ldots,Y\}, j \in \{1,\ldots,Z\} \tag{9}$$

$$h_{ij} = 2i + j \qquad\qquad i \in \{1,\ldots,X\}, j \in \{1,\ldots,Z\} \tag{10}$$

2.3 Non-Negativity Constraints

$$r \geq 0 \tag{11}$$

$$x_{ikj} \geq 0 \qquad\qquad i \in \{1,\ldots,X\}, k \in \{1,\ldots,Y\}, j \in \{1,\ldots,Z\} \tag{12}$$

$$c_{ik} \geq 0 \qquad\qquad i \in \{1,\ldots,X\}, k \in \{1,\ldots,Y\} \tag{13}$$

$$d_{kj} \geq 0 \qquad\qquad k \in \{1,\ldots,Y\}, j \in \{1,\ldots,Z\} \tag{14}$$

3 Results

LP files were generated with parameters $X = Z = 9, Y \in \{3, 4, 5, 6, 7, 8\}$. These were then processed with CPLEX, recording the time taken to solve each problem. Important data points were extracted from the CPLEX output and are listed in table 1.
